13. P[illegible] bear[illegible] hav[illegible] laye[illegible]f ____ t[illegible]keep [illegible]e[illegible]warm.	
14. A[illegible]n[illegible]al[illegible]hat eat plants a[illegible]alled ____.	
15. Mammals live in every ____ in the worl[illegible]	
16. There are over ____ species of mammals.	

PREVIEW

MAMMALS
PREVIEW
Mammals all have teeth, too, except ant eaters.
Mammals mate to reproduce. Then, most mammals carry the developing baby inside the uterus or womb. The only exceptions are the platypus and echidnas, who lay eggs. However, after the eggs hatch, the offspring drink milk from the mother, thus they are mammals. The length of time the mother carries the baby depends on the species. For example, the gestation of a hamster is only two weeks, elephants can be pregnant for up to 22 months, and humans for about nine months. Most mammals give birth to live young.
Marsupials have six-week-long pregnancies and give birth to underdeveloped young. After birth, the baby crawls into a pouch on the mother and remains there up to a year, feeding on the mother's milk supply. Kangaroos, koalas, and opossums are marsupials.
Mammals are the only animals that have mammary glands which
