LANDFORMS

of various landforms such as mountains, a form is defined simply as a natural feature on a part of the terrain.

highest mountains on Earth, found all over the world. Mount Everest, located in the Himalayas of Nepal and Tibet, is the tallest mountain above sea level, at 29,029 feet (8,848 meters).

But Mauna Kea, located in the Pacific Ocean near Hawaii, is the tallest mountain from base to tip. It is over 33,000 feet high.

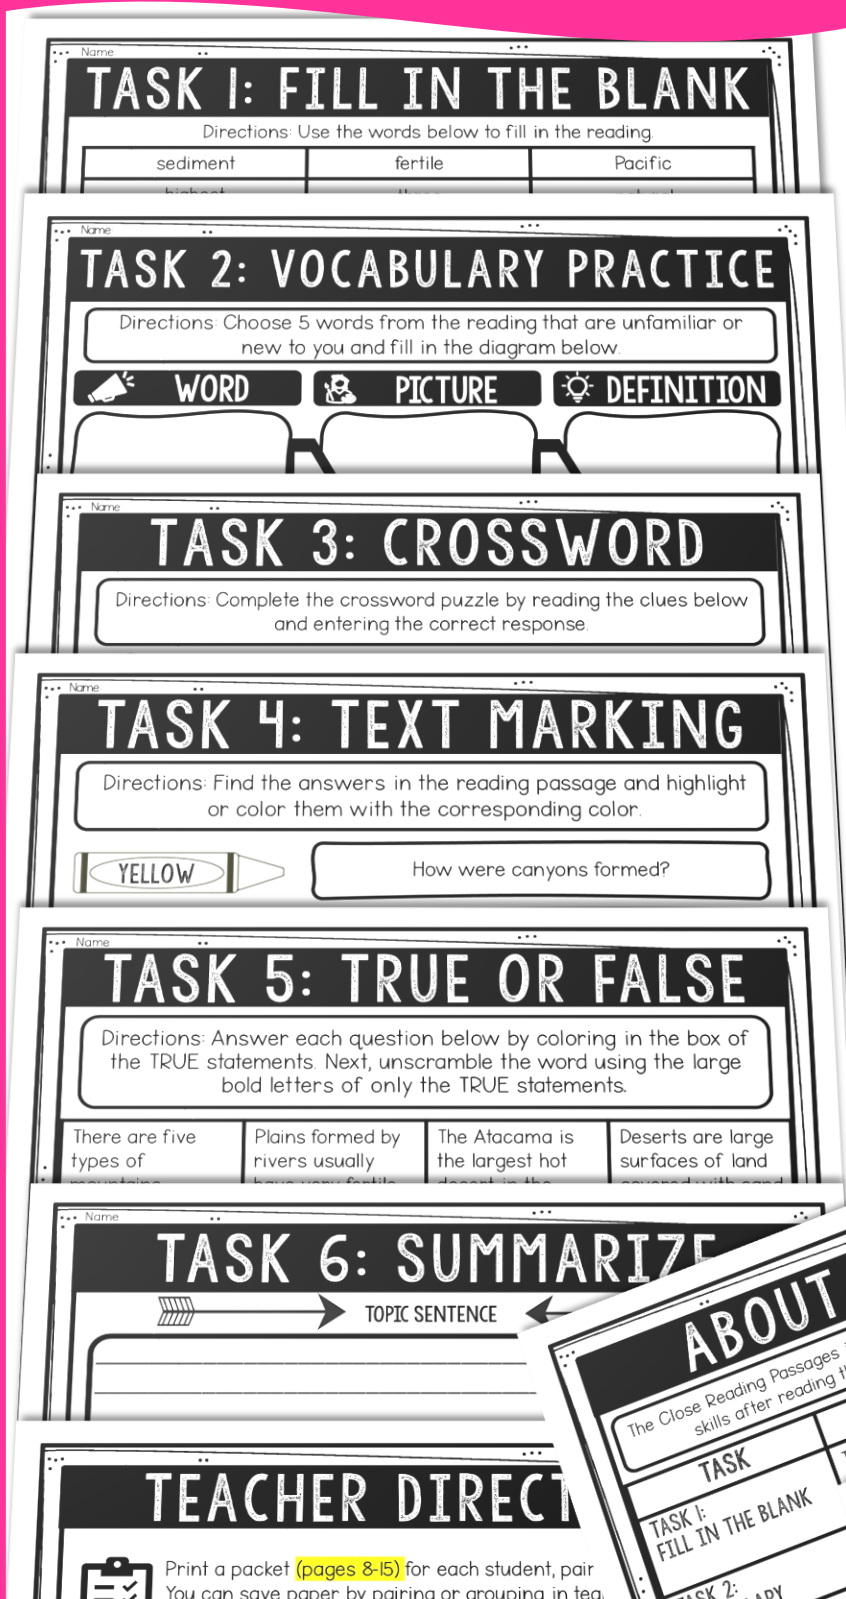

Mountains usually have a cone shape and peak on top formed by tectonic plates pushing together. Sometimes, volcanoes helped develop mountains by erupting and hardening lava flows out of the volcano and hardens on top.

There are three types of mountains – volcanic mountains, block mountains, and fold mountains.

Volcanic mountains reach up high, valleys are landforms that form between mountains and hills. First, rivers flow through the valleys, and over time, the fertile soil is worn down by the river water. Eventually, the river widens and becomes a floodplain. The fertile soil is the land that grows as time goes by. The fertile soil is the land that grows as time goes by. Sediment flows along the river, and over time, the current slows down, and deposits on the bottom. After an extended period, the deposits form a delta. Famous deltas include the Nile Delta, the Ganges Delta, and the Brahmaputra Delta.
